

## Overview of Common Data Collection Methods

Method	Description	Cost	Type of Data Typically Produced	Other Considerations
 <p><b>Document Review</b></p>	Review of existing documents or records, such as project records and reports, policies or standard operating procedures, written correspondence, photos, videos, etc.	Typically <b>low</b> ; depends on number of documents reviewed.	 <p>Qualitative</p>	<ul style="list-style-type: none"> <li>• May be difficult to access files or records</li> <li>• Records or policies may be out of date</li> <li>• May not include the exact information you are looking for</li> </ul>
 <p><b>Review of Existing Datasets</b></p>	Review of existing datasets, such as project records and reports, shared data from other teams or organizations, etc.	Typically <b>low</b> ; depends on number of datasets reviewed and how clean the data is.	 <p>Quantitative</p>	<ul style="list-style-type: none"> <li>• May be difficult to access data</li> <li>• Data may be out of date</li> <li>• May not include the exact data you are looking for</li> <li>• If indicators or recordkeeping practices have changed, trend analysis can be difficult</li> <li>• To assess the data's quality, you need to understand how records were compiled and how missing data was addressed</li> </ul>
 <p><b>Individual In-depth Interviews</b></p>	One-on-one conversations with individuals who may have specific knowledge about a topic of interest. Typically use an open-ended ( <i>semi-structured</i> ) format, allowing interviewer to ask follow-up questions to pursue topics in depth.	Typically <b>moderate</b> ; depends on number and duration of interviews conducted, interpretation needs, incentives provided, etc. Significant staff time may be needed for analysis.	 <p>Qualitative</p>	<ul style="list-style-type: none"> <li>• Interviewers must be careful not to introduce bias</li> <li>• Useful during exploratory stage before designing a structured survey</li> <li>• Findings are about individual experiences or opinions. While common themes may emerge, findings may not be generalizable.</li> </ul>

Method	Description	Cost	Type of Data Typically Produced	Other Considerations
 <b>Focus Group Discussions</b>	Structured interviews with small groups (6–12 individuals), typically using both standardized and follow-up questions, to collect information about people’s awareness, knowledge, attitudes, and practices.	Typically <b>moderate</b> ; depends on number and duration of discussions, interpretation needs, incentives provided, need for travel, etc. Significant staff time may be needed for analysis.	 Qualitative	<ul style="list-style-type: none"> <li>• Good for gathering feedback on a service or product</li> <li>• Can provide information on group dynamics</li> <li>• Requires a facilitator who must be careful not to bias the conversation</li> <li>• Discussion can be sidetracked or dominated by a few individuals</li> <li>• Can be difficult to analyze</li> </ul>
 <b>Surveys</b>	Systematic collection of information from a defined population. May be <i>self-administered</i> (respondents complete a paper-and-pencil or electronic questionnaire) or <i>enumerated</i> (administered by trained staff ( <i>enumerator</i> ) via in-person or phone interviews).	Can be <b>low, moderate, or high</b> ; depends on sample size, mode of administration (in person vs. phone vs. online), need for translation or interpretation, use of enumerators, use of incentives, etc.	 Quantitative	<ul style="list-style-type: none"> <li>• Survey design can take time and often requires testing/piloting</li> <li>• Design requires knowledge of the subject area and survey questionnaire development</li> <li>• Accuracy depends on sample size and who responds</li> <li>• Sample limited to willing and reachable respondents</li> <li>• May have low response rates</li> <li>• Further considerations depend on whether survey is self-administered or enumerated, as well as language and access issues</li> </ul>
 <b>Observation</b>	Method of watching or looking at an event, process, interaction, or place to gather information. May be structured or unstructured. Observer may use a form, checklist, or other tool to guide what they are looking for. Observer documents what they see and analyzes the notes.	Typically <b>moderate</b> ; depends on type and number of observations conducted, training required for staff, need for travel, etc.	 Qualitative	<ul style="list-style-type: none"> <li>• Allows an action, process, or place to be studied in real time</li> <li>• May reveal problems or patterns that other people are unaware of or unable to describe</li> <li>• Susceptible to observer bias</li> <li>• Those being observed can behave differently because of the presence of the observer</li> <li>• Important to allow sufficient time for observations</li> <li>• Can be difficult to analyze</li> </ul>

The IRC received competitive funding through the U.S. Department of Health and Human Services, Administration for Children and Families, Grant #90RB0053. The project is 100% financed by federal funds.
